Hi, I'm Hafeni · IT Project Manager in Switzerland

I turn messy data into systems that run on their own.

Data platforms, migrations and automation, delivered with teams in Switzerland and India.

```

IT Project Manager

Data Analyst

Application / IT Support

// 01 Client project · Logista · 2023–today

Used by: invoice processing team and client staff

Invoices that process themselves

> PROBLEM

700+ suppliers, an old system, ~15% errors. Growth meant more staff.

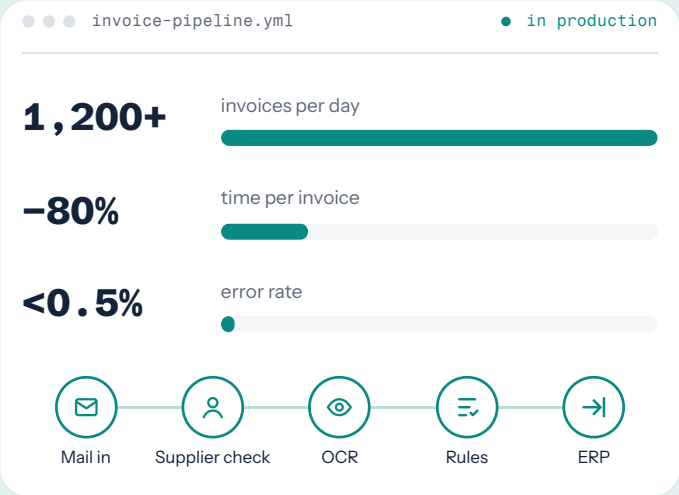

> WHAT I DID

Led the new platform, wrote the invoice rules, ran a live switch-over.

> RESULT

Double the capacity, 80% faster, almost no errors.

#Spring Boot #Zoho CRM #XML / SFTP #Rulesets

04 / problems solved

Real-world problems, fixed with my team

Issues from live operation, and how we handled them.

Wrong names from OCR Seller or customer name sometimes wrong	→	Compare with the CRM lists (starts with / ends with / contains) and show the correct name
Real customer hidden Extracted data showed the buying group, not the end customer	→	Keyword rules in DE/FR/IT/EN first; then a CRM lookup with a review queue, old rules kept as fallback
Suppliers with branches Branch not in the structured data	→	Read it from the invoice text with start and end markers; supplier + branch became the unique key
Signed PDFs slipping through A 5-minute job missed some signed invoices	→	Signature removed at submission instead, with 3 retries, logging and a weekly safety scan
Vendor limits Files over 350 KB rejected; outages and timeouts left ~195 invoices unprocessed	→	Reprocessed oversized files, sent very large ones in parts, traced and resubmitted the stuck invoices

05 / who decided what

Who decided what

The client sets the requirements. I'm responsible for delivering them and for the decisions in between.

CLIENT & MANAGEMENT

- Replace the whole platform
- Rules managed by the client
- Cut-over date and go/no-go
- Already processed signed invoices stay as they are

ME, WITH THE DEVELOPERS

- Which extracted fields go into the API calls, which objects to read
- How VAT lines are handled
- Keyword rules to trace sellers and customers
- Accepted a developer's idea: CRM lookup for customers

MY CALL

- Planned the cut-over steps and the fallback
- CRM fallback when OCR names are wrong
- Seller and customer rules kept fully separate
- A person always reviews unmatched invoices

// 02 Client project · Swiss association management firm · 2026

Used by: ~300 member companies and the firm's admins

Years of statistics, moved with zero differences

> PROBLEM

Industry statistics lived in Excel, Access and an undocumented database.

> WHAT I DID

Led the data management: decoded the old data with the team, designed the rules, set the priorities.

> RESULT

Every migrated period matches the source. One rule model for all ~15 mandates.

#Pimcore #SQL #Data mapping #Rule engine

migration/reconcile.sql — in progress

0 **differences** after checking every migrated period against the old database.

180+	14M+	19,000+
tables decoded	data cells	periods moved

Check → Add up → Protect → Publish

05 / who decided what

Who decided what

The client provides the requirements. I'm responsible for the data management and the decisions that keep it on course.

CLIENT

- Requirements and report layouts
- Confidentiality limits per statistic
- How their data is shown, e.g. calendar weeks

ME, WITH THE TEAM

- Extract mandate data from one large legacy table
- Clean, link, new database and schema
- Move formulas into code, so new data adds up instantly
- Build the rulesets

MY CALL

- Priorities and the sprint plan to the client workshop
- One rule model with inheritance (base → mandate → report)
- Keep only the rules that matter: limits the client sets, simple input checks
- I test the rulesets myself, with the testers

06 / problems solved

Problems solved on the way

What the legacy data hid, and how the team and I handled it.

Hidden status flags Locked and deactivated periods were not documented	→	Traced where they are stored and carried them over 1:1: 19,000+ periods, reconciled with 0 differences
Company mergers Risk of counting a company twice	→	Checked it in the figures, corrected an assumption about which periods were affected, proposed a "merged into" link for future mergers
Import errors Wrong join logic and duplicate rows in the data load	→	Found them during reconciliation and gave the developers precise technical feedback to fix them
Unreliable recent data Recent figures affected by mergers and corrections	→	Kept testing on the agreed stable year; a full data refresh comes after testing

// 03 Group project · prefex.ch · 2025

Used by: the public and partner companies

Pension funds, compared in one place

> PROBLEM

Comparing 2nd and 3rd pillar (BVG) investments was hard for anyone.

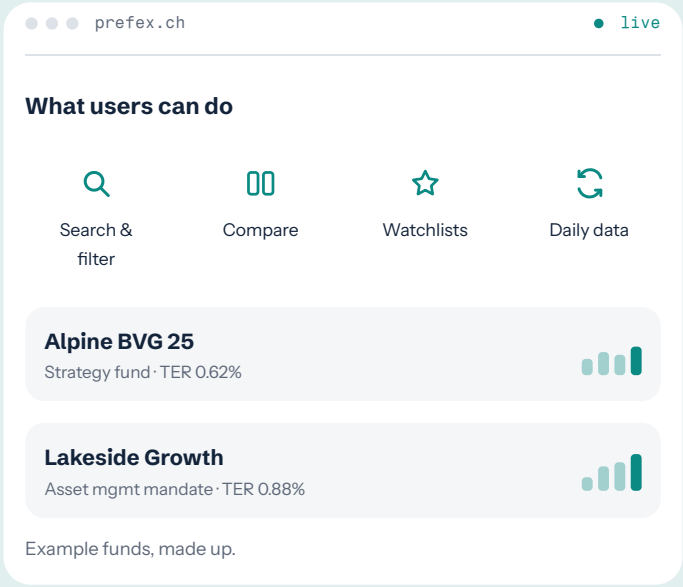

> WHAT I DID

Project manager for Releases 3–5; led the team for providers, documents and factsheets.

> RESULT

Search, compare and track funds with data updated every day.

#Pimcore #FTP imports #FX API #GitHub

Example funds, made up.

04 / who decided what

Who decided what

Liberty set the direction. I ran the delivery, from design approval to release.

CLIENT & MANAGEMENT

- Scope of each release
- Which providers and partners appear

ME, WITH THE TEAM

- Pimcore classes and objects for the funds
- Daily imports via cron jobs, exchange-rate API
- Releases dev → stage → live, code on GitHub

MY CALL

- Approved designs and functions before release
- Point of contact for the fund data providers
- Set up a provider myself first, then led the team doing it
- Weekly meetings with developers and client

// 04 Group project · Lealta / Liberty · 2026

Used by: the forms team

One form, four languages, no mistakes

> PROBLEM

Pension forms rebuilt in Pimcore had to match the originals in DE, EN, FR and IT.

> WHAT I DID

Built forms that generate PDFs, checked every version, trained the team.

> RESULT

10+ form types checked in 4 languages; missing legal text found before release.

#Pimcore #PDF #QA #Training

03 / caught before release

What the checks caught before release

Findings written as Old → New for the developers, then re-checked after each fix.

Missing legal text Declarations and a wrong purpose statement on a strategy-change form	→	Caught before release and reported to the developers
German text in other languages Same error in many EN/FR/IT forms	→	Traced to one shared module, so it was fixed once at the root
Wrong brand or language Content of one foundation in another's forms; wrong-language headers	→	Flagged per form and language; fixes re-checked
Small but visible errors Wrong dot character in links, stale dates, missing fields	→	Tracked across all forms until resolved or knowingly deferred

04 / who decided what

Who decided what

CLIENT

- Which forms and content
- Intentional changes, e.g. removing a P.O. box

ME, WITH THE TEAM

- Building forms and partner profiles in Pimcore
- Fixes prioritised with the developers

MY CALL

- The QA method and the Old → New format
- No go-ahead until deferred bugs are knowingly accepted
- Re-check every fix after each release

One team, two countries

~30 developers, testers, designers in India · 8 colleagues in Switzerland

I'm the bridge: I turn what the client needs into clear tasks for the developers, and explain technical topics back in plain language.
